Routing Algorithms Results

Conclusion

Goals and objectives

Net Revenue for Video Delivery Applications in USA

Goals and objectives

In 2016, More than 96 % of internet traffic is content.

Video → 60%

File sharing → 20%

Web → 20%

Goals and objectives

Mobile vs PC Internet Traffic user → 5G mobile networks

CISCO & PIRL

Cisco Systems France.

ICN Brief Introduction

Virtualization and Linux Containers

Routing Algorithms Results

Conclusion

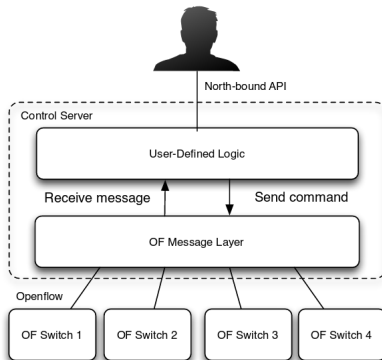

Named Data networking (NDN)

Why ICN?

- ▶ **Named Data Networking** \Rightarrow **Name** base Philosophy vs TCP/IP **Calling** Networking.
- ▶ V.Jacobson et al proposition, *Networking Named Content* 2009.
- ▶ A Good fit network designing for Video Delivery Applications in **5G**.
- ▶ **Lurch** is an orchestrator originally developped for ccnx.
- ▶ We developped Lurch:
 - ▶ For NFD (NDN forwarder).
 - ▶ Different interfaces to interact with strategies at run time (Client, Repositories, forwarding strategies, ...)
 - ▶ *New Routing Strategies*.

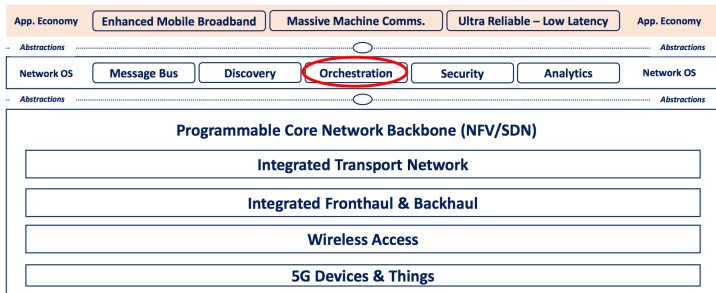

Named Data networking (NDN)

- ▶ **Lurch** is an orchestrator originally developed for ccnx.
- ▶ We developed Lurch:
 - ▶ For NFD (NDN forwarder).
 - ▶ Different interfaces to interact with strategies at run time (Client, Repositories, forwarding strategies, ...)
 - ▶ *New Routing Strategies.*

Named Data networking (NDN)

- ▶ **Lurch** is an orchestrator originally developed for ccnx.
- ▶ We developed Lurch:
 - ▶ For NFD (NDN forwarder).
 - ▶ Different interfaces to interact with strategies at run time (Client, Repositories, forwarding strategies, ...)
 - ▶ *New Routing Strategies.*

Virtualization and Linux Containers

Virtual Machines (VM) vs Linux Containers.

Containers are isolated, but share OS and, where appropriate, bins/libraries

Large Scale Platform Grid5000

Grid5000 platform

Routing Strategies

We proposed 4 different routing strategies for different situation of networks which can cover all of needs:

- ▶ **TreeOnConsumer** : N clients searching the same content from one repository detected by Lurch (Multicast mode).
- ▶ **TreeOnProducer**: One client who gets the packet from N Repositories of needed data.
- ▶ **MinCostMultiPath**: Using different paths with Equal Cost to retrieve the data using a proper forwarder strategy (load-balancing).
- ▶ **MaxFlow**: Allow to maximize the throughput using paths based on maximum flow algorithm between clients and repositories.

Ideas and Strategies

Routing Algorithms Results

TreeOnConsumer
TreeOnProducer
MinCostMultiPath
Maximum Flow

Conclusion

TreeOnConsumer

One producer to multiple consumer.

TreeOnConsumer

One producer to multiple consumer.

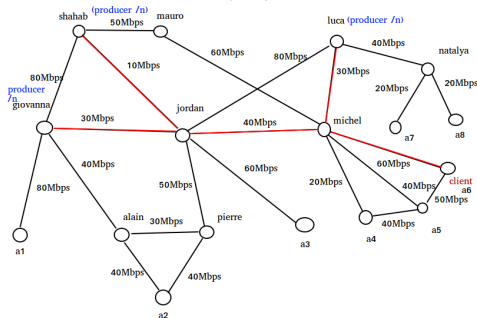

TreeOnProducer

One Consumer to multiple producer.

TreeOnProducer

One Consumer to multiple producer.

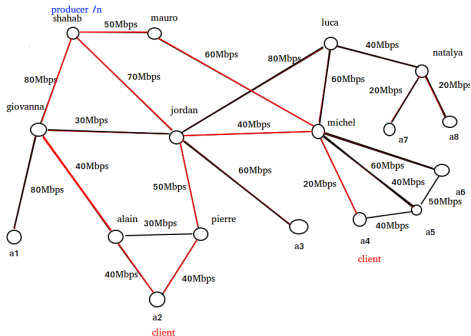

MinCostMultiPath

Load balancing strategies in equal cost multipath case.

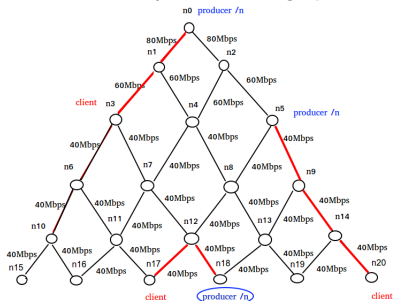

MinCostMultiPath

MinCostMultiPath

Producer Mobility with Routing update.

Maximum Flow

Maximum Flow algorithm chooses the path which maximizes through from consumer to producer.

Maximum Flow

Maximum Flow algorithm chooses the path which maximizes through from consumer to producer.

Routing Algorithms Results

Conclusion

Conclusion

- ▶ There is always some limitations in practical against pure theoretical works which can be seen when you work on experimental platforms.
- ▶ ICN is one of the most challenging domain who has a lot of field of work and domain in research and development.
- ▶ In Engineering there is always bottlenecks, understanding and discovering of where these bottlenecks are the responsibility of genius engineer.
- ▶ Coding is beautiful tool because through it you can realize your ideas in real world.
